

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~striketrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

1. (currently amended) A steering device for toy, comprising:
right and left turning members to turn right and left steering wheels in clockwise and counterclockwise directions;
a connecting member to connect the right and left turning members with each other;
a coil and magnetic body to move the connecting member in right and left directions by carrying a current to the coil; and
a torsion spring to keep the connecting member at a neutral position when the current is not carried to the coil,
wherein the right and left turning members are turned by moving the connecting member in right and left directions so as to change each direction of the steering wheels;
one of the coil and the magnetic body is provided on the connecting member, the other of the coil and the magnetic body is fixed to a fixing portion, and the connecting member is moved in right and left directions when the coil and the magnetic body come close to and go away from each other coaxially;
the connecting member takes at least two steering positions by controlling a current to be carried to the coil with a coil current carrying unit; and
the coil is an air core coil.

2. (original) The steering device for toy as claimed in claim 1, wherein the magnetic body is a permanent magnet and is provided on the connecting member, and the coil is fixed to the fixing portion.

3. (original) The steering device for toy as claimed in claim 2, wherein the permanent magnet is provided so as to direct two poles of the permanent magnet to right and left directions, and the coil is provided so as to face an edge portion of the coil to one of the two poles.

4. (original) The steering device for toy as claimed in claim 1, wherein the connecting member comprises a spring for keeping the connecting member in a neutral position in which the connecting member is not biased toward a right direction nor a left direction when the current is not carried to the coil; and
the connecting member takes three steering positions.

5. (currently amended) A steering device for toy, comprising:
right and left turning members to turn right and left steering wheels in clockwise and counterclockwise directions;
a connecting member to connect the right and left turning members with each other;
an air core coil to apply an electromagnetic force to move the connecting member in right and left directions to turn the right and left steering wheels;
a magnetic body to attract/repel the air core coil coaxially when a current is supplied to the air core coil;
a current carrying control unit to control an operation of the air core coil; and
a torsion spring to keep the connecting member at a neutral position when the current is not carried to the coil.

6. (currently amended) A running toy comprising:
a steering device for toy, comprising:
right and left turning members to turn right and left steering wheels in clockwise and counterclockwise directions;
a connecting member to connect the right and left turning members with each other;
a coil and a magnetic body to move the connecting member in right and left directions by carrying a current to the coil; and
a torsion spring to keep the connecting member at a neutral position when the current is not carried in the coil,
wherein the right and left turning members are turned by moving the connecting member in right and left directions to change each direction of the steering wheels;
wherein
one of the coil and the magnetic body is provided on the connecting

member, the other of the coil and the magnetic body is fixed to a fixing portion;

the connecting member is moved in right and left directions when the coil and the magnetic body come close to and go away from each other coaxially;

the connecting member takes at least two steering positions by controlling a current to be carried to the coil with a coil current carrying control unit; and

the coil is an air core coil.

7. (original) The running toy as claimed in claim 6, further comprising a suspension for moving the right and left turning members in upper and lower directions in a predetermined range; the suspension comprising a biasing member which is supported in a middle of a width direction of the running toy so that right and left edge portions of the biasing member are elastically deformable in upper and lower directions and which extends on the right and left turning members; wherein the turning members are pressed with the right and left edge portions by a biasing force which is caused by elastically deforming the biasing member, so that the right and left steering wheels are in contact with a ground.

8. (cancelled)

9. (cancelled)

10. (currently amended) A running toy comprising:

a steering device comprising:

right and left turning members to turn right and left steering wheels in clockwise and counterclockwise directions;

a connecting member to connect the right and left turning members with each other;

an air core coil to apply an electromagnetic force to move the connecting member in right and left directions to turn the right and left steering wheels;

a magnetic body to attract/repel the air core coil coaxially when a current is supplied to the air core coil;

a current carrying control unit to control a current carried to the air core coil, so that the connecting member takes at least two steering positions;

a torsion spring to keep the connecting member at a neutral position when the current is not carried to the coil; and

a suspension device to press the right and left turning members which are movable in upper and lower directions in a predetermined range, so that the right and left steering wheels are in contact with a ground.

11. (currently amended) The steering device as claimed in claim 1, further comprising:

a trim to adjust the neutral position of the connecting member by precisely adjusting a position of the torsion spring,

wherein the trim ~~comprises~~includes

an eccentric cam to ~~hang~~receive an end-~~position~~ of the torsion spring; and

a lever to rotate the eccentric cam, wherein the eccentric cam is rotated and the position of the torsion spring and the neutral position of the connecting member are ~~precisely~~ adjusted by operating the lever.

12. (currently amended) The running toy as claimed in claim 6, further comprising:

a trim to adjust the neutral position of the connecting member by precisely adjusting a position of the torsion spring,

wherein the trim ~~comprises~~

an eccentric cam to ~~hand~~receive an end-~~position~~ of the torsion spring; and

a lever to rotate the eccentric cam, wherein the eccentric cam is rotated and the position of the torsion spring and the neutral position of the connecting member are ~~precisely~~ adjusted by operating the lever.

13. (currently amended) A steering device for a toy, comprising:

right and left turning members to turn right and left steering wheels;

a connecting member to connect and turn the right and left turning members to take at least two steering positions in correspondence with coil current from a coil current carrying unit;

an air core coil and a magnetic body, one of the air core coil and the magnetic body on the connecting member and the other fixed to a fixing portion, to use coil current to move the connecting member in right and left directions as the coil and magnetic body coaxially approach/depart from each other; and

a torsion spring to hold the connecting member in neutral when no coil current is applied.

14. (currently amended) A steering device for a toy, comprising:
right and left turning members to turn right and left steering wheels;
a tying member to connect the right and left turning members;
an air core coil to, upon receiving current, apply an electromagnetic force to move the tying member in right and left directions, to turn the right and left steering wheels;
a magnetic body to attract/repel the air core coil coaxially;
a control unit to control current to the air core coil; and
a torsion spring to keep the tying member in neutral when the coil current is halted.
15. (currently amended) A running toy comprising:
a steering device for the toy, comprising:
right and left turning units to turn right and left steering wheels;
a tying member, to tie and move the right and left turning units into at least two steering positions in correspondence with coil current from a coil current control unit;
an air core coil and a magnetic body, one on the tying member and the other fixed to a fixing portion, to move the tying member in right and left directions when a current is applied to the air core coil, moving the air core coil coaxially toward/away from the magnetic body; and
a torsion spring to keep the tying member in neutral when the current is halted.
16. (currently amended) A running toy comprising:
a steering device comprising:
right and left turning units to turn right and left steering wheels;
a tying member to tie and move the right and left turning units into at least two steering positions;
an air core coil to apply an electromagnetic force to move the tying member in right and left directions to turn the right and left steering wheels;
a magnetic body to attract/repel the air core coil coaxially due to the electromagnetic force;
a control unit to control a current to the air core coil;
a torsion spring to keep the tying member in neutral when the current is halted;
and
a suspension device to press the right and left turning units which are movable in upper and lower directions in a predetermined range, to force the right and left steering wheels

to contact a ground.

17. (New) The steering device for a toy as claimed in claims 1, 5, 6, 10, 13, 14, 15 or 16, further comprising a turnable device for adjusting the position of the spring.

18. (New) The steering device as claimed in claims 1, 5, 6, 10, 13, 14, 15 or 16, wherein the magnetic body includes a permanent magnet or a material which is magnetized in a magnetic field.

19. (New) The steering device as claimed in claims 1, 5, 6, 10 or 13, wherein the connecting member is movable between a left steering position, through a neutral position, and a right steering position.

20. (New) The running toy as claimed in claims 14, 15 or 16, wherein the tying member is movable between a left steering position, through a neutral position, and a right steering position.

21. (New) The steering device as claimed in claim 19, wherein the connecting member takes the neutral position when the current is not carried to the coil.

22. (New) The running toy as claimed in claim 20, wherein the tying member takes the neutral position when the current is not carried to the coil.

23. (New) The steering device as claimed in claim 19, wherein the connecting member takes the left and right positions, respectively, corresponding to a direction of the current being carried to the coil.

24. (New) The running toy as claimed in claim 20, wherein the tying member takes the left and right positions, respectively, corresponding to a direction of the current being carried to the coil.

25. (New) The running toy as claimed in claims 6, 10, 15 or 16, wherein the toy is remotely controlled.

26. (New) A steering device for toy, comprising:

right and left turning members to turn right and left steering wheels in clockwise and counterclockwise directions;

a connecting member to connect the right and left turning members with each other;

a coil and magnetic body to move the connecting member in right and left directions by carrying a current to the coil;

a torsion spring to keep the connecting member at a neutral position when the current is not carried to the coil,

wherein the right and left turning members are turned by moving the connecting member in right and left directions so as to change each direction of the steering wheels;

one of the coil and the magnetic body is provided on the connecting member, the other of the coil and the magnetic body is fixed to a fixing portion, and the connecting member is moved in right and left directions when the coil and the magnetic body come close to and go away from each other,

the connecting member takes at least two steering positions by controlling a current to be carried to the coil with a coil current carrying unit; and

the coil is an air core coil; and

a trim to adjust the neutral position of the connecting member by precisely adjusting a position of the torsion spring,

wherein the trim includes

an eccentric cam to receive an end of the torsion spring; and

a lever to rotate the eccentric cam, wherein the eccentric cam is rotated and the position of the torsion spring and the neutral position of the connecting member are adjusted by operating the lever.

27. (New) A running toy comprising:

a steering device for toy, including

right and left turning members to turn right and left steering wheels in clockwise and counterclockwise directions;

a connecting member to connect the right and left turning members with each other;

a coil and a magnetic body to move the connecting member in right and left

directions by carrying a current to the coil;

a torsion spring to keep the connecting member at a neutral position when the current is not carried in the coil,

wherein the right and left turning members are turned by moving the connecting member in right and left directions to change each direction of the steering wheels;

wherein one of the coil and the magnetic body is provided on the connecting member, the other of the coil and the magnetic body is fixed to a fixing portion;

wherein the connecting member is moved in right and left directions when the coil and the magnetic body come close to and go away from each other,

wherein the connecting member takes at least two steering positions by controlling a current to be carried to the coil with a coil current carrying control unit; and

wherein the coil is an air core coil; and

a trim to adjust the neutral position of the connecting member by precisely adjusting a position of the torsion spring,

wherein the trim includes

an eccentric cam to receive an end of the torsion spring; and

a lever to rotate the eccentric cam, wherein the eccentric cam is rotated and the position of the torsion spring and the neutral position of the connecting member are adjusted by operating the lever.
